

Money Tracker Web Application

Project Description

Money Tracker is a web-based personal finance management application designed to help individuals monitor, organize, and manage their money. The system allows users to record money coming in and going out, monitor the balance of each bank or e-wallet account, track savings and expenses, and manage their daily allowance.

The application automatically updates account balances whenever the user records an income, withdrawal, expense, transfer, or savings transaction. This allows users to easily see where their money is stored and how much money is available for spending.

1. Dashboard

The Dashboard serves as the main page of the application. It provides an overview of the user's current financial situation.

It can display:

- Total Money – combined balance of all registered accounts.
- Total Income – total money received within a selected period.
- Total Expenses – total money spent.
- Total Savings – money allocated for savings.
- Emergency Fund – money reserved for emergencies.
- Daily Allowance – remaining amount that can be spent for the day.
- Recent Transactions – latest income, expenses, transfers, and withdrawals.
- Account Balances – balance of each bank/e-wallet.

Example:

Account	Balance
MariBank	₱8,500
BPI	₱12,000
GoTyme	₱3,500
Cash	₱1,500
Total	₱25,500

2. Bank and Account Management

Users should be able to add and manage different accounts where their money is stored.

Example accounts

- MariBank
- BPI
- GoTyme
- GCash
- Cash
- Other

- Current balance
- Account description
- Date added
- Status (Active/Inactive)

Account Types

- Bank Account
- E-Wallet
- Cash
- Savings Account
- Other

For every account, the system can store

- Account name
- Account type

The user should also be able to edit, delete, or deactivate an account.

3. Income Tracking

The system should allow users to record all money that comes into their possession. The user can select the purpose/category of the incoming money.

Examples:

In – Savings

Which account?

- MariBank
- BPI
- GoTyme
- GCash
- etc.

In – Allowance

Which account?

- MariBank
- BPI
- GoTyme
- Cash
- etc.

In – Salary

Which account?

- BPI

- MariBank
- GoTyme
- etc.

In – Emergency Fund

Which account?

- MariBank
- BPI
- GoTyme
- etc.

In – Gift

Which account?

- MariBank
- BPI
- Cash
- etc.

Other possible income categories:

- Salary
- Allowance
- Freelance income
- Business income
- Gift
- Refund
- Scholarship
- Interest
- Other

The user should enter:

- Amount
- Date
- Category
- Account where the money was received
- Description/notes

The system will automatically add the amount to the selected account balance.

4. Outgoing Money / Expense Tracking

The application should track money that leaves an account. For every expense, the user selects where the money was taken from.

Example:

Expense: ₱150
Category: Food
Taken from: GoTyme
If GoTyme has ₱3,500: $₱3,500 - ₱150 = ₱3,350$

The system automatically updates the account balance.

Expense Categories

- Food
- Transportation
- School
- Bills
- Shopping
- Entertainment
- Health
- Personal
- Online Shopping
- Subscriptions

- Emergency
- Other

The expense record can contain:

- Amount
- Category
- Account used
- Date
- Time
- Description
- Optional receipt/image

5. Money Transfer Between Accounts

This would be an important feature because users may move money between their own accounts.

Example:

Transfer ₱2,000 from BPI to MariBank. The system will automatically:

BPI: ₱10,000 → **₱8,000**
MariBank: ₱5,000 → **₱7,000**

The system should recognize this as a transfer rather than an expense, so the user's total money does not decrease.

Transfer information:

- From account
- To account
- Amount
- Date
- Notes

6. Savings Management

The system can provide a separate section for savings goals. Users can create goals such as:

- New Phone
- Laptop
- Tuition
- Travel
- Emergency Fund
- New Clothes
- School Project
- General Savings

Example:

Laptop Fund

Target:	₱50,000
Current Savings:	₱18,000
Remaining:	₱32,000
Progress:	36% saved

The system can automatically calculate the progress of each savings goal.

7. Emergency Fund

A separate emergency fund section can help users monitor money reserved specifically for unexpected expenses.

Users can set:

- Emergency fund target
- Current emergency savings
- Monthly contribution
- Emergency withdrawals

Example:

Emergency Fund Goal:	₱30,000
Current:	₱15,000
Remaining:	₱15,000

If money is withdrawn for an emergency, the system records the withdrawal and updates the emergency fund balance.

8. Allowance Management

The Allowance Page can help users determine how much money they can spend each day.

The user can enter:

- Total allowance
- Allowance period
- Number of days
- Savings target

- Expected expenses

For example:

Monthly allowance: ₱10,000
Days: 30
Savings target: ₱2,000
Available spending money: $₱10,000 - ₱2,000 = ₱8,000$
Daily spending allowance: $₱8,000 \div 30 = ₱266.67/\text{day}$

The system can then track whether the user is:

- Under the daily limit
- At the daily limit
- Over the daily limit

9. Daily Spending Tracker

The system can compare the user's planned daily spending with their actual spending.

Example:

Date	Daily Limit	Actual Spending	Difference
Sept. 1	₱267	₱200	₱67
Sept. 2	₱267	₱300	-₱33
Sept. 3	₱267	₱150	₱117

This allows the user to see their spending habits.

If the user spends less than their daily allowance, the remaining amount can be considered potential savings.

10. Budget Suggestions

The application can provide simple suggestions based on the user's recorded income and spending.

For example:

Your average daily spending is ₱220, while your daily allowance is ₱267. You have ₱47 remaining today.

It can also suggest:

You currently have excess money in your spending account. Consider allocating part of it toward your savings goal.

The system should make suggestions based on the user's configured budget and actual transactions rather than automatically moving money without permission.

11. Transaction History

A complete transaction history should allow users to see everything that happened to their money.

Example:

Date	Type	Category	Account	Amount
Sept. 19	Income	Allowance	BPI	+₱1,000
Sept. 19	Expense	Food	GoTyme	-₱150
Sept. 18	Transfer	Savings	BPI → MariBank	₱500
Sept. 18	Expense	Transportation	Cash	-₱80

Users should be able to:

- Search transactions
- Filter by date
- Filter by account
- Filter by category
- Filter by income/expense
- Edit transactions

- Delete incorrect transactions

12. Reports and Statistics

The application can provide visual reports to help users understand their financial habits.

Possible reports:

Income vs. Expenses

Shows how much money came in compared with how much was spent.

Spending by Category

For example:

- Food – ₱3,000
- Transportation – ₱1,500
- School – ₱2,000
- Shopping – ₱1,000

Account Distribution

Shows how the user's total money is distributed among different accounts.

Monthly Savings

Shows how much the user saved each month.

Charts such as pie charts, bar charts, and line charts can be used.

13. Notifications and Alerts

The system can notify users about important financial activities.

Examples:

- Daily allowance is almost exhausted.
- User exceeded today's spending limit.
- Savings goal is close to completion.
- An account balance is low.
- Monthly budget has been reached.
- A recurring payment is due.

Example:

Budget Alert: You have already spent 90% of your monthly food budget.

14. Recurring Transactions

Users can record transactions that happen regularly.

Examples:

- Monthly allowance
- Salary
- Internet bill
- Phone bill
- Subscription
- Rent
- Monthly savings

The system can remind the user when a recurring transaction is due.

15. Search and Filtering

The application should allow users to easily find financial records.

Users can search for:

- Transaction name
- Account
- Category
- Amount

- Date

Filters can include:

- Today
- This week
- This month
- Custom date range
- Income
- Expense
- Transfer

16. Security and User Account

Since the application contains financial information, users should have their own account.

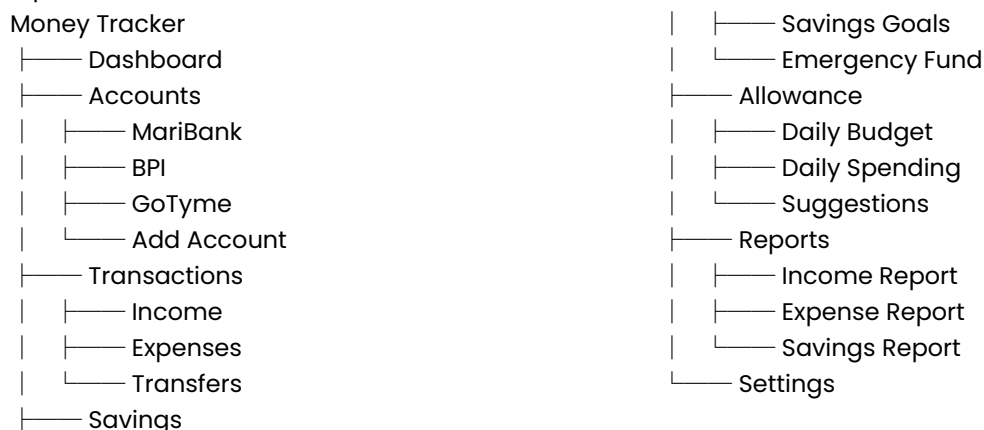

Possible features:

- Register
- Login
- Logout
- Password protection
- Change password
- Profile management

The system should not require actual bank login credentials. Users manually record their transactions unless you later decide to integrate a legitimate banking/financial API.

17. Main Pages

A possible website structure would be:

Main Goal of the System

The main purpose of Money Tracker is to give users a centralized view of their finances. Instead of checking different bank applications, writing expenses manually, or calculating their remaining allowance themselves, the user can record their financial activities in one system.

The important part is that every transaction affects the appropriate account automatically:

Income → adds money to an account

Expense → deducts money from an account

Transfer → deducts from one account and adds to another

Savings → records money allocated toward a savings goal

Allowance → calculates available daily spending

This gives you a fairly complete project scope while still keeping the core functionality manageable for a student web application.
